

Adidas Sales Performance Analysis

Data Analytics Capstone Project

Prepared by **Wendy Shabalala**

BSc Chemistry & Biochemistry Graduate | Data Analytics Portfolio

A practical analysis of Adidas retail sales performance across products, retailers, regions, sales methods and time periods using Microsoft Excel.

August 2026

Executive Summary

This project analyses Adidas retail sales data to evaluate business performance across products, retailers, sales channels and geographic regions. Microsoft Excel was used to organise the data, create Pivot Tables and Pivot Charts, and develop an interactive dashboard for communicating performance trends and business insights.

The analysis recorded **\$899.9M** in total revenue, **\$332.1M** in operating profit, approximately **2.48M units sold**, and an operating margin of **36.9%**. The West was the strongest region by revenue, while West Gear was the highest-performing retailer. Women's Apparel was the highest-revenue product category, and in-store sales generated the largest contribution among the three sales methods.

The results indicate opportunities to protect strong-performing products and retailer relationships while improving weaker regions, retailers and digital sales. The recommendations in this report demonstrate how descriptive analytics can be translated into practical business actions.

Key Performance Indicators

Metric	Result
Total Revenue	\$899.9M
Operating Profit	\$332.1M
Units Sold	2.48M
Operating Margin	36.9%

1. Background

Adidas operates across multiple retail partners and sales channels, generating large volumes of information about products, locations, retailers and customer purchasing activity. When sales information is analysed systematically, it can help decision-makers understand where revenue is being generated and where performance may require attention.

This project uses an Adidas retail sales dataset as a practical business analytics case study. The purpose is not to make claims about Adidas' current real-world performance, but to demonstrate an end-to-end analytical workflow using the provided dataset.

2. Business Problem

The available sales data contains information across products, retailers, regions, sales methods and time periods. Without structured analysis, it can be difficult to identify the main contributors to revenue, recognise underperforming areas, and translate sales patterns into actionable recommendations.

3. Project Objectives

- Measure overall sales and profitability performance.
- Identify top- and lower-performing product categories.
- Compare major retailer contributions to revenue.
- Evaluate regional sales performance.
- Compare in-store, outlet and online sales methods.
- Identify monthly, quarterly and seasonal sales patterns.
- Translate analytical findings into business recommendations.

4. Dataset Overview

The dataset contains Adidas retail sales observations covering product categories, retail partners, regions, sales methods and time-based measures. Revenue, operating profit and units sold were used as core performance measures.

Analytical dimensions

Dimension	Purpose
Product Category	Compare revenue generated by product lines.
Retailer	Identify major retail partners and their contribution.
Region	Compare geographic sales performance.
Sales Method	Evaluate in-store, outlet and online channels.
Month / Quarter	Understand time-based sales trends.
Season	Compare seasonal sales performance.

5. Methodology

The analysis followed a descriptive analytics workflow. The source data was organised in Excel and summarised using Pivot Tables. Pivot Charts were then created to compare categories, regions, retailers, sales methods and time periods. Slicers were incorporated into the dashboard to allow interactive filtering.

The dashboard was designed around four headline KPIs—revenue, operating profit, units sold and operating margin—followed by supporting visualisations.

6. Supporting Pivot Table Analysis

Pivot Tables were used to aggregate sales performance across product categories, retailers, regions, sales methods, quarters, seasons and months. These summaries formed the analytical foundation for the dashboard visualisations.

Supporting Pivot Table Analysis

Sales summaries used as the analytical foundation for the dashboard

A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P
Product Category	Sum of Total Sales			Region	Sum of Total Sales			Sum of Total Region

Figure 1. Supporting Pivot Table Analysis

7. Dashboard Overview

The dashboard combines headline KPIs, interactive slicers and supporting charts to communicate performance across multiple business dimensions. Users can filter sales method, retailer, product category and region while reviewing the resulting performance patterns.

Figure 2. Executive Sales Performance Dashboard

8. Supporting Visual Analysis

The supporting charts provide additional detail on product categories, regional performance, sales methods, seasonality and quarterly trends.

Figure 3. Supporting sales performance visualisations

9. Key Insights

Overall performance. The dataset records total revenue of **\$899.9M** and operating profit of **\$332.1M**, with an operating margin of **36.9%** and approximately **2.48M units sold**.

Product performance. Women's Apparel was the highest-revenue product category at approximately **\$167.7M**. The remaining categories were relatively close in revenue, suggesting performance was not concentrated in only one product line.

Regional performance. The **West** region generated the highest revenue at approximately **\$269.9M**, while the **Midwest** was the lowest of the five regions at approximately **\$135.8M**.

Retailer performance. **West Gear** was the strongest retailer at approximately **\$243.0M**, followed by **Foot Locker** at approximately **\$220.9M**.

Sales method. In-store sales contributed approximately **\$356.6M**, followed by outlet sales at approximately **\$295.6M** and online sales at approximately **\$247.7M**.

Time and seasonality. Quarter 3 was the strongest quarter at approximately **\$265.3M**, while Summer was the strongest season at approximately **\$262.4M**.

10. Business Recommendations

Product Strategy. Protect momentum in high-performing categories such as Women's Apparel while investigating why lower-performing categories trail the leaders. Monitor category performance alongside units and profitability rather than revenue alone.

Regional Focus. Use the West's strong performance as a benchmark for understanding demand drivers, while investigating the Midwest's lower contribution. Regional campaigns and inventory decisions should reflect local demand patterns.

Retail Partner Management. Maintain strong relationships with high-performing partners such as West Gear and Foot Locker, while working with lower-performing partners to identify constraints and opportunities.

Channel Optimisation. Continue supporting the strong in-store channel while investing in initiatives that can improve online performance. Further analysis should examine conversion and average transaction value before major channel investment decisions.

Demand Planning. The stronger Q3 and summer performance suggests that time-based patterns should be considered when planning inventory and promotional campaigns. Future analysis could develop demand forecasts.

11. Limitations

This project is a portfolio analysis based on the supplied dataset. The analysis is primarily descriptive and identifies patterns rather than establishing causal relationships. No external customer, marketing-spend, inventory, target or benchmark data was incorporated.

Because the analysis is based on historical sales information, the findings should not be interpreted as forecasts of future performance without additional modelling and validation.

12. Future Improvements

- Build a demand forecasting model using historical monthly sales.
- Add profit-margin analysis at product, retailer and regional levels.
- Compare actual performance against targets or benchmarks.
- Use Python and pandas for reproducible data cleaning and exploratory analysis.
- Use SQL to query and aggregate the underlying sales data.
- Develop a Power BI version of the dashboard with a scalable data model.
- Investigate customer-level behaviour if customer or transaction-level data becomes available.

13. Conclusion

This project demonstrates an introductory end-to-end data analytics workflow: defining a business problem, organising sales data, summarising performance, building visualisations, identifying patterns and translating findings into business recommendations.

The analysis shows that performance in the dataset varies across products, regions, retailers, sales methods and time periods. The resulting dashboard provides a concise way to explore these patterns and supports the use of data as an input into commercial decision-making.
